Q7 Brief about the service oriented Architecture. Does web services follows SOA? Justify.

Ans) i) service-oriented Architecture (SOA) is a style of software design where services are provided to the other components by application components, through a communication protocol over a network. A SOA service is a discrete unit of functionality that can be accessed remotely and acted upon and updated independently, such as receiving a credit card statement only. SOA is also intended to be independent of vendors, products, and technologies.

ii) A service has four properties according to one of the many definitions of SOA:

- It logically represents a business activity with a specific outcome.
- Self-contained
- Consumer does not have to be aware of the services' inner workings.
- It may consist of underlying services.

iii) A web service is an example of an SOA with a well defined set of characteristics or implementation choices. SOA, as the name says, is an architectural concept which focuses

on having different services communicating with each other to carry out a bigger job.

Thus, a web service is a building block in an SOA.

Q2> Brief about Business and Technical Motivations for web services?

A2> Business motivations for web services :-

- Managing complexity and IT costs.
It is possible to build powerful systems with simple components such as web services.
- Lingua Franca of B2B E-Commerce
Business to Business (B2B) commerce has been around for more than a decade. XML provided the basis for building such vocabularies because of its inherent extensibility.
- Global E-Marketplace Vision.
Business requires a way for companies to locate, identify, contact and transact with other companies.

Technical Motivation for Web Services:

- a) Limitation of CORBA and OGN
- b) Problems with vendor dependence
- c) Reuse & integration pats.

83) Analyse the problem with business modeling and vendor dependence.

A3) i) As the market matures, other vendors will offer individual passage that are of a higher quality than single vendor, making a "bait of forced" approach more attractive.

ii) The purchasing company's business grows to depend on the business strategy of the vendor. Shifts in strategic direction or business problems at the vendor can filter down to the vendor's customers.

iii) It is very difficult to integrate a "one-stop shop" vendor's product with other vendor's products at other companies. As a result a single vendor approach limits the ~~population~~ potential of e-business.

iv) Taking a vendor-independent software strategy solves the problems of vendor dependence.
